Make a microservice ecosystem which consists of four services:
- Discovery Service
- Gateway Service
- Employee Service
- Reimbursement Service
- Config Server

● Gateway, Employee, and Reimbursement services should be registered with eureka
● Use gateway service to route requests to employee and reimbursements accordingly
● Use feign client to display a single employee's reimbursement when retrieving their information
● Provide fallback implementation for the reimbursement service client and use circuit breaking to improve fault tolerance
● Enable Hystrix Dashboard and use it to monitor the employee service and its interaction with the reimbursement service
● Create a config server which centralizes the configuration for your employee and reimbursement services - this will require creating a github repository with your application specific configuration

Please put these completed services in their own "Microservices" folder on your branch by Monday
